

# WEEKLY ECONOMIC & FINANCIAL COMMENTARY

April 17, 2009

## U.S. Review

### "Less Bad" Is Good

The recent rebound in the stock market, a less downbeat than feared earnings season, and a few better than expected readings in the economic numbers have raised hopes that we can now see the light at the end of the deep recession tunnel. We hope so. Our fear, however, is that much of the recent improvement merely marks a shift in the rate of deceleration in economic activity. That still marks an improvement but it does not change our view that the recession will drag on through late this year.

For all the new found optimism in the economy this week there was actually very little good economic news to support it. Most reports were merely not as bad as they were in recent months. Activity is still declining, just not as rapidly as it was during the fall and winter months. One notable change, however, is that some of the more leading reports are now improving.

The Empire Manufacturing survey rose nearly 24 points to a negative 14.65 in April. The index still remains solidly in negative territory, however, and suggests cutbacks in the manufacturing sector are lessening a bit.

## Global Review

### Any Signs of Hope in Singapore?

Data released this week showed that real GDP in Singapore fell 11.5 percent in the first quarter relative to the same period in 2008. As such, it was the deepest year-over-year contraction on record in the Singaporean economy (official GDP data start in 1975).

A detailed breakdown of GDP into its underlying demand components is not yet available. When the data do become available in another month or so they likely will show that gross exports were a primary reason that GDP fell as sharply as it did. Singapore is one of the most open economies in the world, and the global recession is quickly transmitted to the Lion City. Indeed, monthly trade data show that the volume of Singaporean exports plunged 20 percent in the first quarter (see graph at the top of page 4).

The weakness does not appear to be confined to just the external sector.

**U.S. Review**

*(Continued from Page 1)*

**Some Leading Indicators Are Showing Signs of Improvement**

Within the Empire Survey one of the largest improvements was in the new orders component, which rose to -3.88 from -44.76. There were also sizable improvements in the shipments component and number of employees series. In addition, the number of firms liquidating inventories continued to increase and fewer firms reported that delivery times were shortening. The latest figures are consistent with what you would expect to see in the latter stages of recession and show that, even though conditions remain exceptionally weak, progress is being made.

The Philadelphia Fed's survey of manufacturing conditions showed similar improvement but to a lesser extent. The general business activity diffusion index rose 10.6 points to -24.4. New orders rose 16.4 points to -24.3. The percentage of firms reporting shorter delivery times also improved and fewer firms reported that they were liquidating inventories. The extent of the improvement, however, was far less than in the Empire Survey and the inventory and employment components remain exceptionally weak.

One of this week's best reports came from the housing sector. The NAHB/Wells Fargo Housing Market Index rose 5 points to 14 in April, marking its most significant improvement since the housing slump began. The index remains extraordinarily low, however, and few homebuilders could be said to be upbeat. That said, the recently enacted \$8,000 tax credit for first-time homebuyers, along with lower mortgage rates, larger than expected tax refunds, and the onset of the peak spring home-buying season; are giving builders some encouragement. Sales are reported to have improved and expectations for future sales have increased. That said, buyer traffic is merely less negative than builders felt it was a month ago.

Another encouraging report is that first-time claims for unemployment insurance declined for the second week in row, tumbling 53,000 in the last week. The drop helped pull the four-week moving average down to 651,000 from its recent high of 659,500. We wish we could buy in to the notion that layoffs have peaked. The latest figures are for the week before Easter, which are extremely hard to seasonally adjust. Continuing unemployment claims rose and the insured unemployment rate rose another tenth of a point to 4.5 percent. The insured unemployment rate has been rising a tenth of a percentage point a week and that has matched up nearly perfectly with the rise in the unemployment rate. The latest figures suggest the unemployment rate will climb to 8.8 or 8.9 percent in April.

**Philadelphia Fed General Activity Index**

**NAHB/Wells Fargo Housing Market Index**

**Unemployment Measures**

**Existing Home Sales • Thursday**

The National Association of Realtors estimates about 45 percent of recent sales activity nationwide was either distressed or foreclosure-related over the past several months. With distressed sales accounting for such a large proportion of activity, we could actually see reported sales fall off sharply if efforts to modify existing mortgages gain traction in the next few months. Timing is difficult to estimate given the considerable lag of the data, but we would not be surprised to see sales move lower from here. We would not necessarily consider the declines to be a bad thing considering the initial cause of the downturn. The moratoriums, however, may extend the recovery period.

We expect to see existing home sales remain little changed in March as low mortgage rates and the latest decline in home prices seem to be supporting the market at these low levels.

**Previous: 4.72M**

**Wachovia: 4.70M**

**Consensus: 4.70M**

**Existing Home Resales**

**Durable Goods Orders • Friday**

Despite the surprising strength we saw in February's durable goods orders data, we continue to believe economic growth is still on course to contract substantially in the first quarter. With corporate profits under considerable pressure, excess capacity in many industries and restrictive lending standards, durable goods orders should continue to contract for the remainder of the year.

We expect advance durable goods orders to retreat significantly in March to better reflect the weak economic conditions of the first quarter. Outsized gains in machinery and technology equipment should reverse. In addition, low order bookings for domestic civilian aircraft last month suggest aircraft activity will remain depressed. The one positive may be an increase in motor vehicle orders as auto plants have now come back online.

**Previous: 3.4%**

**Wachovia: -3.5%**

**Consensus: -1.2%**

**NonDefense Capital Goods Orders, Ex-Aircraft**

**New Home Sales • Friday**

Sales of new homes will likely continue to struggle during the first half of 2009 as employment, economic concerns and mortgage market troubles outweigh the improvements in overall affordability we have seen. Declines in completions and in general building activity mean less supply will be coming to the marketplace. Inventories may return to the "equilibrium" levels of the late 1990s by early this summer. There are a number of powerful incentives to purchase a new home in place today, including builder discounts, tax rebates for first-time home buyers and exceptionally low mortgage rates.

With home builder surveys either holding steady or rising slightly, albeit from very low levels, we expect new home sales will only decrease slightly in March to an annualized pace of 323K units.

**Previous: 337K**

**Wachovia: 323K**

**Consensus: 340K**

**Inventory of New Homes for Sale**

Global Review

(Continued from Page 1)

Weakness in exports has a knock-on effect on domestic demand via income. For example, longshoremen who lose their jobs spend less in the domestic economy. As shown in the middle chart, retail spending turned down sharply in the first two months of 2009. The drop-off in exports also probably had a negative effect on business fixed investment spending in the first quarter.

However, the worst may be over for the Singaporean economy. As reported previously, the Chinese economy, which has extensive trade ties with Singapore, has shown some signs of acceleration recently. (See "Signs of Stronger Growth in China," which is posted on our website.) In addition, growth indicators in many other countries are not as negative now as they were a few months ago due, at least in part, to expansionary macroeconomic policies that have been put in place. As the downdraft in global trade becomes less intense, the shock to the Singaporean economy should start to dissipate. In that regard, the value of Singapore's exports rose nearly 11 percent in March relative to the previous month. Although real GDP could very well contract again in the second quarter, the rate of decline should be smaller than it was in the first quarter.

Because the city-state is such an open economy, the trade-weighted value of the Singapore dollar is the primary target of the Monetary Authority of Singapore (MAS). When the economy was booming and inflation was a problem, the MAS allowed the currency to appreciate on a trade-weighted basis, but it shifted its stance last October to allow zero appreciation. The MAS held a regularly scheduled policy meeting this week and most investors had expected it to sanction a depreciation of the trade-weighted value of the currency going forward due to the depth of the economic slump. A weaker currency would help to stimulate the economy via stronger exports. In the event, the MAS decided to keep its policy unchanged.

Looking forward, we project the Sing dollar will depreciate modestly further versus the U.S. dollar. In our view, the depreciation of the currency vis-à-vis the greenback will be offset by appreciation against some other major currencies such as the Japanese yen and the euro. (For details, see our *Monthly Economic Outlook*, which is posted on our website.)

Singapore Exchange Rate

**Euro-zone PMIs • Thursday**

Available monthly indicators suggest that the Euro-zone economy contracted further—probably at a sharp rate—in the first quarter. Did factory orders, which were down 34 percent in January on a year-over-year basis, drop even further in February? Data slated for release on Thursday will answer that question.

With the first quarter in the history books, attention is turning to the current quarter. In that regard, a number of surveys will give investors insights into the current state of the Euro-zone economy. The ZEW index, which is a survey of German institutional investors, will be released on Tuesday, and the more closely watched Ifo index of German business sentiment will print on Friday. The manufacturing and service sector PMIs for the entire Euro-zone are slated for release on Thursday. The consensus anticipates a slight rise in both indices.

**Previous Manufacturing PMI: 33.9      Consensus: 34.7**  
**Previous Services PMI: 40.9      Consensus: 41.2**

**Euro-zone Purchasing Manager Indices**

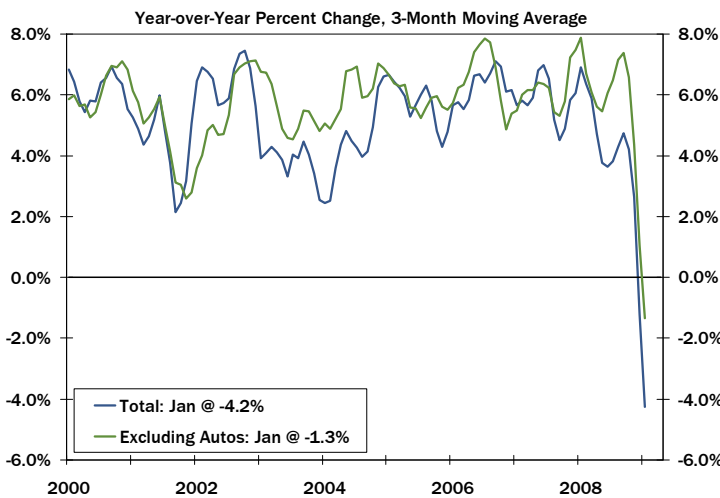

**Canadian Retail Sales • Thursday**

After falling at the fastest pace in at least a decade during the month of December, Canadian retail sales bounced somewhat in January, rising 1.9 percent for the month. Other than that respite, domestic demand in Canada is showing the same weakness as it is in other countries. On Thursday, retail sales data for February will be released and we would not be surprised to see a reversion to the recent downward trend.

Earlier in the week, the Bank of Canada (BoC) will announce its decision on whether to adjust the bank's policy rate. We suspect the BoC will opt to leave rates unchanged at 0.50 percent. Having lowered rates by 400 basis points since December 2007, the BoC will now likely turn to the extension of credit and measures of quantitative easing to provide stimulus.

**Previous: 1.9%**  
**Consensus: -0.3%**

**Canadian Retail Sales**

**British Real GDP • Friday**

The British economy contracted at an annualized rate of 6.1 percent in the fourth quarter of 2008, and official GDP data to be released on Friday are expected to confirm monthly indicators suggesting that real GDP fell sharply again in the first quarter. The British economy is likely in the middle of its deepest recession since the early 1980s.

There are a few other data releases on the docket next week that will give investors more insights into the current state of the U.K. economy. The labor market report for March will be released on Wednesday, and retail sales data for the same month will print on Friday. CPI data are slated for release on Tuesday, although the depth of the current slump has reduced the importance of inflation data in the minds of many investors.

**Interest Rate Watch**
**Rates and Credit in a Slow Recovery**

Our expectations for a moderate economic recovery beginning later this year and continuing into next year are influenced by our credit outlook. For us, the pattern of recovery follows a swoosh more than a V, L or W. A swoosh is characterized by a big downdraft in the fourth quarter of 2008 (GDP down six percent) with better growth numbers each quarter this year. For short rates, this recovery would be consistent with no change in Fed policy and therefore no change in the target funds rate. Moderate growth is consistent with inflation staying well under the Fed's two percent target ceiling. With inflation under control we expect that the Fed will remain committed to a continued expansion of its balance sheet to support financial markets. Therefore we are also positive on continued improvement in market liquidity in sectors such as commercial paper, asset-backed securities and mortgage backed securities.

While the short-end of the yield curve has improved in terms of lower yield and availability, in contrast, private, longer-term part of the credit markets struggle with the availability and pricing of credit. On availability, we have seen a rapid rise in the net percentage of banks tightening credit for both businesses and consumers. Moreover, wherever the Fed is not engaged, such as high yield corporate bonds or CMBS, spreads have not come in substantially and issuance is minimal. Finally, federal deficit financing poses a threat to long-term interest rates and financial stability, though not primarily from inflation fears. Instead, the increased supply of Treasury securities and a loss of confidence in U.S. economic policy could destabilize both the dollar and longer-term Treasury rates.

**Topic of the Week**
**Closing in on a Bottom in 2009**

Signs are beginning to emerge that suggest sales of new and existing homes are moving toward a bottom. Actual sales figures took a positive turn in February and mortgage applications for the purchase of a home have increased in recent weeks as mortgage rates have tumbled. We expect sales to bottom this summer and look for some modest improvement during the second half of the year. Such a turn of events would be consistent with past recessions, when home sales turned around about six months before the broader economy.

Home sales have turned up around the country, particularly in the hardest hit markets, where short sales and foreclosure sales account for a large proportion of transactions. The National Association of Realtors (NAR) estimates that distressed sales have accounted for 45 percent of existing home sales in recent months, which is one reason why prices have fallen so sharply. The combination of falling home prices and lower mortgage rates has made home ownership much more affordable. The NAR Housing Affordability Index has surged more than 50 points over the past six months and is at an all-time high.

Home sales bottoming out does not mean sales are about to turn decisively higher. While housing affordability has improved and investor sales (to investors rather than speculators) have increased, we doubt home sales will turn up in a decisive way until employment conditions improve. Our latest forecast has the unemployment rate rising through the middle of next year. As a result, we do not see any real strength returning to the housing market until late next year or in 2011.
